SUMMARY

Software Developer with hands-on experience building real-time, map-based operator interfaces for a live public-safety dispatch platform, using React.js, WebSockets (Pusher), and REST APIs. Delivered multi-panel monitoring dashboards and live geolocation tracking features. Building backend depth in Node.js toward full-stack development.

TECHNICAL SKILLS

Frontend: JavaScript (ES6+), React.js, HTML5, CSS3, Tailwind CSS

Backend & Data: Node.js, Express.js, MongoDB, REST APIs

Real-Time: WebSockets (Pusher), Live Data Synchronization

Geospatial: Interactive Maps, Live Location Tracking, Markers & Radius Visualization

Tools: Git, GitHub

PROFESSIONAL EXPERIENCE

Software Developer, Krishnas Digital Technologies & Softlabs

11/2025 – Present | Hyderabad, India

- Built operator-facing modules in React.js for a live emergency dispatch platform, used daily by call takers, dispatchers, and supervisors to manage incoming complaints in real time.
- Developed the Dispatcher Desk, routing incoming complaints from call takers to dispatchers in real time, removing manual handoff delays between the two roles.
- Built a multi-panel Supervisor Desk using WebSockets (Pusher) that consolidates three live data streams into one dashboard: call-taker break requests, stage/status transitions with timestamps for monitoring, and complaint escalations requiring supervisor action — giving supervisors a single real-time view instead of tracking each separately.
- Integrated REST APIs across supervisor and dispatcher workflows to handle request approvals, status updates, and data fetch/sync between UI and backend in real time.
- Ramped up on a large, pre-existing production codebase and became able to independently ship feature changes and bug fixes across multiple modules.

KEY PROJECT

Drone Dispatch & Live Tracking Module, React.js · WebSockets (Pusher) · REST APIs · Interactive Maps

07/2026 – 08/2026

- Built a Drone Dispatch interface displaying live complaint cards (ID, details, geolocation) loaded via REST API on page load, then kept current in real time via WebSockets (Pusher) as complaint stage, police follow-up status, and drone status change, eliminating the need for manual refresh or polling.
- Built an interactive map view rendering complaint markers, drone positions, and coverage-radius circles, letting operators instantly see which complaints fall within an available drone's range.
- Implemented one-click drone dispatch from the map UI, triggering an API call that starts live tracking of the drone's route to the incident location and surfaces its live video feed link directly on the complaint card.

EDUCATION

B.Tech, Computer Science (Data Science), Mallareddy Institute of Engineering And Technology

11/2021 – 05/2025 | Hyderabad, India

CGPA : 7.02

Intermediate – Mathematics, Physics, Chemistry, Sree Sandeepani junior college

06/2019 – 03/2021 | Kamareddy, India

Percentage : 86.2

CERTIFICATES

Full-Stack Development — Innomatics Research Labs
